

Amendments to the Claims:

The following claims will replace all prior versions of the claims in this application (in the unlikely event that no claims follow herein, the previously pending claims will remain):

Claims 1-22. (Previously cancelled).

23. (Previously added) A solid imaging apparatus, said apparatus including:

- (i) a vessel containing a photoformable composition;
- (ii) a movable platform disposed within said vessel;
- (iii) a sub-assembly comprising a movable dispenser, said movable dispenser defining an opening;

wherein said sub-assembly is adapted to both receive and deposit part of said photoformable composition through said opening.

24. (Previously added) The apparatus of claim 23, wherein said opening is a downwardly facing elongated slot.

25. (Previously added) The apparatus of claim 23, wherein said movable dispenser is adapted to deposit part of said photoformable composition above said platform.

26. (Previously added) The apparatus of claim 23, wherein said apparatus further comprises a radiation source capable of curing said photoformable composition.

27. (Previously added) The apparatus of claim 23, wherein said dispenser comprises a pair of plates that hold the lifted composition therebetween.

28. (Currently amended) The ~~coating station apparatus~~ of claim 23, wherein said dispenser includes a holding mechanism that holds the lifted composition above the surface of said photoformable composition in the vessel.

29. (Currently amended) The ~~coating station apparatus~~ of claim 23, wherein the dispenser includes a blade with an edge positioned at the surface of said photoformable composition in the vessel.

30. (Currently amended) The ~~coating station apparatus~~ of claim 23, wherein said dispenser includes a blade with a holding mechanism that holds lifted composition against a surface of the blade.

31. (Currently amended) The ~~coating station apparatus~~ of claim 23, wherein the dispenser includes a pair of plates that form a holding chamber therebetween, wherein a portion of the composition is retained within the chamber while another portion of the composition is allowed to flow from the chamber by force of gravity.

Claims 32-51. (Cancelled herewith).

52. (Currently added) A solid imaging system comprising:

(a) said apparatus including

- (i) a vessel for containing said photoformable composition;
- (ii) a movable platform disposed within said vessel;
- (iii) a sub-assembly comprising a movable dispenser, said movable dispenser defining an opening;

wherein said sub-assembly is adapted to both receive and deposit part of said photoformable composition through said opening; and

(b) a photoformable composition including free radical polymerizable material.

53. (Currently added) The system of claim 52, wherein said opening is a downwardly facing elongated slot.

54. (Currently added) The system of claim 52, wherein said movable dispenser is adapted to deposit part of said photoformable composition above said platform.

55. (Currently added) The system of claim 52, wherein said apparatus further comprises a radiation source capable of curing said photoformable composition.

56. (Currently added) The system of claim 52, wherein said dispenser comprises a pair of plates that hold the lifted composition therebetween.

57. (Currently added) The system of claim 52, wherein said dispenser includes a holding mechanism that holds the lifted composition above the surface of said photoformable composition in the vessel.

58. (Currently added) The system of claim 52, wherein the dispenser includes a blade with an edge positioned at the surface of said photoformable composition in the vessel.

59. (Currently added) The system of claim 52, wherein said dispenser includes a blade with a holding mechanism that holds lifted composition against a surface of the blade.

60. (Currently added) The system of claim 52, wherein the dispenser includes a pair of plates that form a holding chamber therebetween, wherein a portion of the composition is retained within the chamber while another portion of the composition is allowed to flow from the chamber by force of gravity.

61. (Currently added) The system of claim 52, wherein said composition further comprises cationically polymerizable material.

62. (Currently added) The system of claim 52, wherein said free radical polymerizable material includes ethoxylated trimethylolpropane triacrylate.

63. (Currently added) The system of claim 61, wherein said free radical polymerizable material includes ethoxylated trimethylolpropane triacrylate.

64. (Currently added) The system of claim 52, wherein said composition comprises thermally coalescible polymeric cohesive material.
